                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 are detected from the amplified products; (h) the clones in the multiwe plates are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABI42957 to ABI45322 represent PCR primers for human chromosome 1p36-35 DNA, and ABI45323 to ABI45634 represent PCR primers for human chromosome 21q22.1, which are specifically claimed for use in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                  Terminal continuation; poly d(T).

                                                                                                                                                                                                            amplification reaction using primers and determining the size of the amplified DNA fragments obtained. The method is useful for analysing microsatellite loci and for detecting microsatellite instability (MSI) in genomic DNA microsatellite loci of the second genomic DNA, where the MSI results are useful in prognostic tumour diagnosis, in diagnosis of familial tumour predisposition, to detect cancerous tumours of the gastrointestinal system and of the endometrium, where the cancerous tumours are tumours from a colorectal cancer. The method is useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         represents a poly d(T) PCR primer used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Analyzing micro-satellite loci for detecting or diagnosing cancer, by co amplifying set of three microsatellite loci from DNA sample in multiplex reaction using primers, and determining size of amplified fragments.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human MONO-15 loci amplifying primer #2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAD36362 standard; DNA; 18
                                                                                               Sequence 18
                                                                                                                                                                                                                                                                                                                                          The present invention relates to a method of analysing microsatellite loci. The method involves co-amplifying a set of three microsatellite loci comprising at least one mononucleotide repeat locus and at least tetra-nucleotide repeat loci from a sample of genomic DNA in a multiple tetra-nucleotide repeat loci from a sample of genomic DNA in a multiple.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            14-SEP-2001; 2001WO-US028647

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ΒX
                                                                                                                                                                                                                                            The present invention describes a method for the comparative detection of the amount of an RNA. The method comprises: (a) cDNAs obtained by CC transcribing respectively from at least two tissue RNAs obtained by CC transcribing respectively from at least two tissue RNAs obtained by CC fragmented by using a same restriction enzyme; (b) each different adaptor and a common adaptor are added to each of the cDNA fragments derived from the same or different tissues by the step (a); (c) the resultant adaptor added cDNAs are mixed together; (d) an adaptor primer having the common sequence to said different adaptor and a gene-specific adaptor are used to amplify said adaptor-added cDNAs containing no region derived from CC the adaptor-added cDNAs prepared by the step (b); (e) the ratios of the cDNA amounts are measured between the tissues; (f) the RNA is detected CC from the measured between the tissues; (f) the RNA is detected CC from the measured result; (g) each different adaptor and a common adaptor added to each of the genomic DNA fragments derived from a same or different individuals; (h) the resultant adaptor-added genomic DNAs are CC different; (i) the adaptor-added genomic DNAs are amplified by using an adaptor primer having the common sequence to the different adaptor and a sequence-specific adaptor; and (j) the ratios of the amplified by using an adaptor cDNAs are measured between the individuals. The method is used for the detection of the amounts of RNA and DNA. The present common common for the present invention in the common to make the common co

                                                                                                                                                                                                                                                                                                                                                                                             lymphocytic leukaemia and acute myelogenous leukaemia; as probes for determining the cytosine methylation state and/or single nucleotide polymorphisms (SNPs) of haematopoietic cell proliferation disorder related sequences and their complements; and as primers for the amplification of haematopoietic cell proliferation disorder related DNA sequences. The nucleotide sequences from the present invention can also be used for detecting a predisposis, treatment and/or monitoring of haematopoietic cell proliferative disorders. The present method enables highly specific classification of haematopoietic cell proliferative disorders. The present method enables highly specific classification of haematopoietic cell proliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Detecting and differentiating between hematopoietic cell proliferative disorders, comprises contacting a target nucleic acid with a reagent that distinguishes between methylated and non-methylated CpG dinucleotides.
                                                                                                                                                                                                                                                                                                          represent specifically claimed nucleotide sequences from the present invention. Oligonucleotides from the present invention can be used: for differentiating between healthy haematopoietic cells and proliferative disorder haematopoietic cells; for differentiating between acute
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WPI; 2003-018942/01.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Olek A,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              26-MAR-2001; 2001US-0278333P
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            26-MAR-2002; 2002WO-EP003401.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WO200277272-A2

The present invention describes a method for detecting and conditional differentiating between haematopoietic cell proliferative disorders associated with at least 1 gene and/or their regulatory regions in a condition method comprises contacting a target nucleic acid in a conditional sample obtained from the subject with at least 1 reagent, contacting a target nucleic acid in a conditional sample obtained from the subject with at least 1 reagent, contacting a target nucleic acid. ABZ09861 to ABZ11118 conditional subject with at least 1 reagent, contact and non-methylated CPG dinucleotides within the target nucleic acid. ABZ09861 to ABZ11118 converses the specifically claimed nucleotide sequences from the present convention. Oligonucleotides from the present invention can be used: for differentiating between healthy haematopoietic cells and proliferative converses of the cytosine methylation state and/or single nucleotide converses and their complements; and as primers for the converse of the sequences and their complements; and as primers for the converse of the nucleotide sequences from the present invention can also be used for detecting a predisposition to, differentiation between converses of the cases diagrams a predisposition to, differentiation between converses of the cases of

The invention relates to an acyclic linker-containing oligonucleotide comprising at least one modified deoxyribonucleotide. Oligonucleotides of the invention are useful for preventing or decreasing translation, reverse transcription and/or replication of a target RNA in a system. They are useful for selectively preventing gene expression in a sequence-specific manner, for hybridising to complementary RNA such as cellular mRNA or viral RNA, to hybridising to complementary RNA such as cellular RNA. They are also useful therapeutically in formulations or medicaments to prevent or treat a disease characterised by the expression of a particular target RNA. The invention is used in gene therapy. The present

The invention relates to an acyclic linker-containing oligonucleotide comprising at least one modified decoxyribonucleotide. Oligonucleotides the invention are useful for periodic or decreasing translation, reverse transcription and/or replication of a target RNA in a system. They are useful for selectively preventing gene expression in a sequence specific manner, for hybridising to complementary RNA such as cellular

얁

Novel acyclic linker-containing oligonucleotide useful for preventing decreasing translation, reverse transcription and/or replication of a target RNA in a system, comprises a modified deoxyribonucleotide.

                                                                                                   The invention describes a method of treating non-allergic inflammatory disease comprising administering to a subject having or at risk of developing a non-allergic inflammatory disease an immunostimulatory nucleic acid for prevention or treatment of the disease. The method is useful for treating non-allergic inflammatory diseases, such as psoriasis, eczema, allergic contact dermatitis, latex dermatitis or inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease. This sequence represents an immunostimulatory nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 18

                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a new oligonucleoside which comprises at alternating first and second segments. The first segment comprises at least one sugar modified nucleoside. The second segment comprises at least one 2'-deoxynucleoside. The oligonucleoside comprises at least 2 of each of the first and second segments, so that it comprises at least 2 of alternating segments. The oligonucleotide is useful for preparing a composition for inducing RNase H-mediated cleavage of a target RNA in a system, preventing or decreasing translation, transcription or replication of a target RNA in a system, detecting the presence of a target RNA in a system, validating a gene target corresponding to a target RNA in a system, e.g., acquired immune deficiency syndrome (AIDS) or hepatitis B. The invention is useful in gene therapy. The present

                                                                                                                                                                                                                                                                                                        The present invention relates to a new oligonucleoside which comprises at alternating first and second segments. The first segment comprises at least one sugar modified nucleoside. The second segment comprises at least one 2'-deoxynucleoside. The oligonucleoside comprises at least 2 of each of the first and second segments, so that it comprises at least 2 of alternating segments. The oligonucleotide is useful for preparing a composition for inducing RNase H-mediated cleavage of a target RNA in a system, preventing or decreasing translation, transcription or replication of a target RNA in a system, detecting the presence of a target RNA in a system, validating a gene target corresponding to a target RNA in a system, e.g., acquired immune deficiency syndrome (AIDS) or hepatitis B. The invention is useful in gene therapy. The present sequence is an antisense DNA-RNA hybrid used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           misc_RNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            misc_RNA

                                                                                                                                                             S
                                                                                                                                                                                 Matches
                                                                                                                                                                                                    Query Match
                                                                                                                                                                                                                                                least one sugar modified nucleoside. The second segment comprises at least one 2 deoxynucleoside. The oligonucleoside comprises at least 2 each of the first and second segments, so that it comprises at least 4 alternating segments. The oligonucleotide is useful for preparing a composition for inducing RNase H-mediated cleavage of a target RNA in a system, preventing or decreasing translation, transcription or replication of a target RNA in a system, detecting the presence of a target RNA in a system, validating a gene target corresponding to a target RNA in a system or preventing a gene target corresponding to a target RNA in a system or preventing a manual deficiency syndrome (AIDS or hepatitis B. The invention is useful in gene therapy. The present sequence is an antisense DNA-RNA hybrid used in the exemplification of

alternating segments. The oligonucleotide is useful for preparing a composition for inducing RNase H-mediated cleavage of a target RNA in system, preventing or decreasing translation, transcription or replication of a target RNA in a system, validating a gene target that in a system, validating a gene target corresponding to a target RNA in a system or preventing or treating a disease related to target RNA in a system or preventing or treating a disease related to target RNA in a system, e.g., acquired immune deficiency syndrome (AID) or hepatitis B. The invention is useful in gene therapy. The present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Key
                                                                                                                                            The present invention relates to a new oligonucleoside which comprises at alternating first and second segments. The first segment comprises at least one sugar modified nucleoside. The second segment comprises at least one 2'-deoxynucleoside. The oligonucleoside comprises at least 2 each of the first and second segments, so that it comprises at least 4 alternating segments. The oligonucleotide is useful for preparing a alternating segments.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  misc_RNA

                                                                                                                            The present invention relates to a new oligonucleoside which comprises at alternating first and second segments. The first segment comprises at least one sugar modified nucleoside. The second segment comprises at least one 2'-deoxynucleoside. The oligonucleoside comprises at least 2 of each of the first and second segments, so that it comprises at least 4 calternating segments. The oligonucleotide is useful for preparing a composition for inducing RNase H-mediated cleavage of a target RNA in a system, preventing or decreasing translation, transcription or replication of a target RNA in a system, validating a gene target corresponding to a target RNA in a system, validating a gene target corresponding to a target RNA in a system, e.g., acquired immune deficiency syndrome (AIDS) or hepatitis B. The invention is useful in gene therapy. The present sequence is a target RNA used in RNAse H assay. This sequence is used in the exemplification of the invention

                                                                                                                                                                                                                                                                                                                                                  in any complete or partial genetic map of the human genome. GH-
polypeptides are useful as antagonists of GH-1 hormone action.
Polypucleotides encoding these polypeptides are useful in gene
The present sequence is a PCR primer used for amplifying human
                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to growth hormone 1 (GH-1) gene including single nucleotide polymorphisms (SNP). The GH-1 diagnostic polynucleotide is useful as markers for the analysis of a disease, of susceptibility to drug treatment for GH-1 dysfunction or other diseases, or may be included
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New growth hormone 1 (GH-1) diagnostic polynucleotide, useful as markers for the analysis of a disease, or of susceptibility to drug treatment for GH-1 dysfunction or other diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI; 2003-449555/42.

The method compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represent an immunostimulatory nucleic acid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          08-MAY-2003

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     'the invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
       The invention relates to a method of inhibiting corneal allograft rejection, by contacting the allograft with a topical formulation comprising an antisense oligonucleotide targeted to intercellular adhesion molecule-1 (ICLM-1), extracellular adhesion molecule-1 (ICLM-1) or vascular cell adhesion molecule-1 (VCM-1). The oligonucleotide is useful for inhibiting corneal allograft rejection or for preserving a corneal explant ex vivo, where the explant is human. This sequence corresponds to one of the oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 18

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 18
                                                                                                                                                                                                             The invention relates to a method of analysing microsatellite loci. Invention is used to detect microsatellite instability in prognostic tumour diagnosis, particularly a familial tumour predisposition, especially to detect cancerous tumours of the gastrointestinal system endometrium, most particularly colorectal cancer. Also included are the optineurin promoter CC operably linked to a heterologous nucleic acid, a nucleic acid capable of CC detecting a single nucleotide polymorphism (SNP) in the optineurin CC promoter, a host cell comprising the promoter operably linked to a CC heterologous sequence, diagnosing or prognosing glaucoma in a sample CC obtained from a cell or bodily fluid (comprising detecting a polymorphism CC in a promoter region of the optineurin gene, associated with a glaucoma CC phenotype), detecting a SNP sequence variation in a sample containing CNA, detecting the presence of an optineurin promoter sequence variation in a sample containing DNA, determining the presence or increased CC susceptibility to glaucoma or to a progressive ocular hypertensive contacting in loss of visual field in a patient (or the severity correspond for in a sample containing in a satient correspondent correspondent in a sample containing in a sample containing in a sample containing CC disorder resulting in loss of visual field in a patient (or the severity correspondent correspondent

Crite invention relates to an isolated nucleic acid (N1) comprising at CC least 20 but not more than 1500 consecutive nucleotides of the optineurin CC promoter appearing as ADE13890. Also included are the optineurin promoter operably linked to a heterologous nucleic acid, a nucleic acid capable of detecting a single nucleotide polymorphism (SNP) in the optineurin cCC promoter, a host cell comprising the promoter operably linked to a CC heterologous sequence, diagnosing or prognosing glaucoma in a sample cCC obtained from a cell or bodily fluid (comprising detecting a polymorphism (SNP) in the optineurin gCC phenotype), detecting a SNP sequence variation in a sample containing DNA, detecting the presence of an optineurin promoter sequence variation in a sample containing DNA, determining the presence or increased cCC disorder resulting in loss of visual field in a patient (or the severity or progression of glaucoma in a patient, comprising providing containing containing the variation within the optineurin cCC obtaining a sample containing the variation within the optineurin containing a sample containing the variation within the optineurin containing a sample containing human genomic DNA, providing a nucleic acid capable of detecting a SNP located within an optineurin promoter, and cc capable of detecting a SNP located within an optineurin promoter, and cc capable of detecting a snp located within an optineurin promoter, and cc capable of detecting a snp located within an optineurin promoter, and cc capable of detecting a snp located within an optineurin promoter. The present sequence is an optineurin promoter motif, repeat element or contains of the containing promoter motif, repeat element or contains of the containing promoter motif, repeat element or contains of the containing promoter motif, repeat element or contains of the containing promoter motif, repeat element or containing promoter motif, repeat element or containing containing promoter motif, repeat element or containing containing promoter motif, 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SNP; glaucoma; progressive ocular hypertensive disorder; glaucoma related disorder; motif; repeat element; regula
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human;

                                                                                                                                                               This invention relates to a novel method for the concurrent interrogation of a number of polymorphic sites in the presence of, and without contretened from, non-designated polymorphic sites. Specifically, it comprises conducting a multiplexed elongation assay by applying one or concording a multiplexed elongation assay by applying one or combination of annealing and elongation steps under temperature controlled conditions. Furthermore, this detection method uses probe controlled conditions. Furthermore, this detection, a superior controlled conditions environmentally multiplexed elongation and relies on enzymatic recognition, a superior controlled conditions and relies on enzymatic recognition, a superior contechnique that no longer depends on differential hybridisation. The green indentify mutations within the cystic fibrosis conductance conductance resultator (CFR) or the human leukocyte antigen (HLA) concurrent interrogation of a multiplicity of conformation sites is useful for genetic testing, carrier screening, conjunction is the suseful for genetic testing, carrier screening, conjunction is the negative control probe used for the elongation of the mediated multiplexed analysis of HLA-DR, in an exemplification of the

                                                                                        acid. The genes and/or their regulatory regions are preferably selected from MDR1, CSNK2B, EGR4, AR, CDK4, RB2, CDC25A, GPIb beta, MYOD1, CDH3, CGSTP1, HIC-1, MGMT, MLH1, MOS, MYC, PTEN, RBL2, TGFBR2, TDF3, CDKN1E, CDKN1E, CDKN1E, CDKN2B, CDKN2B, CDKN2B, CDKN2B, CDKN2B, CDKN2B, CDKN2B, CDKN2B, CDKN2C, CGGSTP1, HIC-1, MGMT, MAK1, BAX or HOXAS. Oligomers, peptide nucleic acid (PNA)-oligomers and/or isolated nucleic acids based on the sequences of the genes are useful for detecting the methylation state of all the CGC dinucleotides within one or more the sequences, or their complements, cfor determining the cytosine methylation state of all the CCC polymorphisms (SNPs), and for differentiating at least two of the medical conditions such as diffuse large B-cell lymphoma, mantle cell lymphoma, chronic lymphocytic leukemia, small lymphocytic lymphoma and follicular clifferentiation between subclasses, diagnosis, prognosis, treating and/or monitoring of lymphoid cell proliferative disorder. reagent that distinguishes between and differentiating between lymphoid cell proliferative comprises contacting a target nucleic acid with at least one hat distinguishes between methylated and non-methylated CpG

Claim 30; SEQ ID NO 354; 448pp; English

The invention relates to a method of detecting and differentiating CC between lymphoid cell proliferative disorders associated with at least CC one gene and/or their regulatory regions in a subject by contacting a CC target nucleic acid in a biological sample obtained from the subject with CC at least one reagent or series of reagents that distinguish between CC methylated and non-methylated CG dinucleotides within the target nucleic cacid. The genes and/or their regulatory regions are preferably selected CC from MDR1, CSNK2B, BGR4, AR, CDK4, RB2, CDC25A, GPID beta, MYOD1, CDH3, CC GSTP1, HIC-1, MGMT, MLH1, MOS, MYC, PTEN, RBL2, TGFBR2, TP73, CDKN1C, CC GSTP1, HIC-1, MGMT, MLH1, MOS, MYC, PTEN, RBL2, TGFBR2, TP73, CDKN1C, CC GSK3beta, ESR1, ABAF1, BAK1, BAX or HOXA5. Oligomers, peptide nucleic cacid (PNA)-oligomers and/or isolated nucleic acids based on the sequences of the genes are useful for detecting the methylation state of all the CC diffurcleotides within one or more the sequences, or their complements, conditions such as diffuse large B-cell lymphoma, mantle cell lymphoma, change are also useful for detecting of a predisposition to, CC differentiation between subclasses, diagnosis, prognosis, treating and/or about the methylation state and or single nucleotide conditions are also useful for detecting of a predisposition to, consistion to, and care also useful for detecting of predispositions of the medical conditions are also useful for detecting of predispositions of the medical conditions are also useful for detecting of predispositions are treating and/or about the sequence of the medical conditions are also useful for detecting of predispositions are treating and/or about the sequence of the medical conditions are also useful for detecting of predispositions within the construction between subclasses, diagnosis, prognosis, treating and/or about the medical conditions are determined and conditions are determined to analyse of CpG positions within the constructions. mentioned genes.

Novel isolated polymucleotide encoded by cardiovascular associated gene, useful for treating cardiovascular disease e.g., high blood pressure, myocardial infarction, stroke, atherosclerosis.

Example; Page 20; 40pp; English.

This invention relates to novel isolated polynucleotides with allelic variations that encode cardiovascular associated (CA) polypeptides, which CC are useful for the identification of therapeutic agents for the treatment CC of cardiovascular disease. Specifically, it refers to methods for CC assessing cardiovascular risks in humans by describing genetic variations CC that diagnose a predisposition or susceptibility for cardiovascular CC diseases including atherosclerosis, ischaemia, hypertension and CC restenosis. The present invention describes specific CA genes that can be used as probes for the detection of genetic polymorphisms. Furthermore, CC they can be used for treating cardiovascular disease such as elevated low density lipoprotein (LDL)-cholesterol levels, high blood pressure, CC abnormal electrocardiographic profile, myocardial infarction or strokes. As such, they can be described as having cardiant, cerebroprotective, CC antiatherosclerotic or hypotensive activities. This oligonucleotide sequence is a PCR primer used for amplifying human beta-migrating cardiant, a CA gene of the

A protein of the invention has osteopathic activity. A polymucleotide of the invention may have a use in gene therapy. The composition and methods of the invention are useful in diagnosing, prognosing or treating osteoarthritis using polymorphisms in the matrilin-3 gene. The present sequence is used in the exemplification

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention describes a method of selecting genetic markers as targets for nucleic acid sequence amplification comprising selecting each of the genetic markers according to a heterozygosity index of 0.5 or greater. Selecting and amplification of genetic markers are useful as targets for nucleic acid sequence amplification, for genetic testing or facilitating multiplex PCR amplification from limiting amounts of target nucleic acid. The methods are also useful for improving genetic diagnostic and screening methods, such as prenatal diagnostic testing, foetal sex determination or genetic identification, e.g. DNA profiling or DNA fingerprinting. The nucleic acid sequence amplification is also useful in forensic analysis of degraded, old, ancient and difficult samples that are difficult to amplify and identify. This sequence represents a PCR primer used in the selection and amplification of genetic markers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Selecting genetic markers as targets for nucleic acid sequence amplification, useful for improving genetic testing, e.g. fetal determination, comprises selecting each of the genetic markers to a heterozygosity index.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to a novel method of typing gene polymorphisms. Specifically, it refers to the identification of the single nucleotide polymorphism 636A in human cytochrome gene CYP2C19, the T6235C SNP in human cytochrome gene CYP2C19, the T6235C SNP in human glutathione-S-transferase gene and the human aldehyde dehydrogenase gene ALDH2. Furthermore, gene polymorphisms in several target nucleic acids may be detected in a single sample by successive amplification of the individual targets. The present invention descries a fast, accurate and highly reproducible method of detecting a base substitution e.g. SNP, insertion of sensitivity to drugs and other substances, as well as other genomic investigations. This oligonucleotide sequence is a PCR primer used to amplify a human CYP1A1 gene, in an exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim

                                                                                                                                                                                                                                                           to form a transcription sample containing a cDNA template; eliminating single-stranded oligonucleotide from the transcription sample; and transcribing the cDNA template into RNA using an RNA polymerase. The method is useful for improving RNA polymerase based RNA transcription from a polynucleotide template. The method inhibits the undesired non-template derived production of RNA in the transcription reaction. Sequences ADI34483-ADI34489 represent oligonucleotides used in a T7 RNA
                                                                                                                                                                                                                                                                                                                                                                          sample. The method involves symmetries transcriptase and an incubating the sample RNA with reverse transcriptase and an oligonucleotide primer that primes synthesis in a direction toward 5' of the RNA; converting the single-stranded cDNA into double-stranded of the RNA; converting the single-stranded cDNA template; eliminating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            single-stranded oligonucleotide from the transcription sample
                                                                                                                                                                                                                                                                                                                                                                                                                                                eliminating single-stranded oligonucleotide from the transample. The method involves synthesizing single-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Example 1;
                                                                                                                                                                                                       Sequence 18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to amplifying for RNA in a sample comprises eliminating single-stranded oligonucleotide from the transcription
                                                                                                                                                                                                                                            transcription reaction.

The invention relates to a novel diagnostic polynucleotide composition.

The polynucleotide composition comprises: a sequence encoding a polypeptide with defined sequences given in the specification; a sequence capable of hybridizing to a melanin-concentrating hormone receptor 1 (MCHR1) gene; a polynucleotide encoding an MCHR1 polypeptide; or a sequence comprising one or more of the nucleotide exchanges (SNP's) given in the specification and at least 8 bases of surrounding sequence of the MCHR1 gene. The composition has anorectic activity. The polynucleotide composition may be used in gene therapy to treat the disorders of the invention. The composition is useful for diagnosing obesity related to the presence of a molecular variant of the MCHR1 gene or a susceptibility to the disorder. The MCHR1 protein or polynucleotide is useful for presenting a medicament for treating or preventing obesity related to the presence of a molecular variant of the MCHR1 gene. This polynucleotide represents an MCHR1 primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches

The composition has anorectic activity. The polynucleotide composition may be used in gene therapy to treat the disorders of the invention. The composition is useful for diagnosing obesity related to the presence of a molecular variant of the MCHR1 gene or a susceptibility to the disorder. The MCHR1 protein or polynucleotide is useful for preparing a medicament for treating or preventing obesity related to the presence of a molecular variant of the MCHR1 gene. This polynucleotide represents an MCHR1 primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Platzer M,

                                         The invention relates to a method of determining a functional property of a fluid in a chamber comprising introducing into the chamber a support to CC which is bound several test elements, each of the test elements comprising a reaction domain and a detection domain, introducing into the CC comprising a reaction domain and a detection domain, introducing into the CC chamber a fluid that is interactive with the reaction domains, removing CC the fluid from the chamber, determining by means of the detection domains companies, and relating the locations to the functional property of the CC chamber, and relating the locations to the functional property of the CC comprises a member of a specific binding pair. The determining of the CC comprises a member of a specific binding pair. The determining of the CC chosen from the flow pattern of the fluid. The functional property is CC chosen from the flow pattern of the fluid, reagent distribution within CC useful for determining a functional property of a fluid in a chamber and CC for synthesising arrays of biopolymers e.g., arrays of polymucleotides. CC The method is a companied for the characterisation of a new fluid in a known CC combination. This sequence represents a test element used in the method of a feature of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     S
                                                                                        The present invention relates to detecting the methylation state of the CC contacting a target nucleic acid having one or more sequences selected CC from 5 3581 base pair sequences in a biological sample with at least one CC methylation state of the 5 and promoter region of the gene DD3 within a cC methylation state of the 5 and promoter region of the gene DD3 within a cC subject. The set of oligonucleotides comprising at least three of the CC oligoners is useful for detecting the cytosine methylation state and/or cc single nucleotide polymorphisms (SNPs) within SEQ. ID NO. 1-5 and its complementary sequences. The set of oligoners is also useful for detecting the methylation state of all CpG dinucleotides within SEQ ID CC oligonucleotides can be used as primer oligonucleotides for the CC amplification of DNA sequences selected from SEQ ID NO. 1-5 and its complementary sequences selected from SEQ ID NO. 1-5 and its complementary sequences selected from SEQ ID NO. 1-5 and its complimentary sequences selected from SEQ ID NO. 1-5 and its comprising diseases associated with the methylation state of the gene DD3 comprising at least one nucleic acid. The methods, nucleic acids, coligonucleotide or pNA-oligomer, kit, array or the set of cligonucleotide or pNA-oligomer, kit, array or the set of cligonucleotide or the therapy of cell proliferative disorders. It can also be used for the therapy of cell proliferative disorders. The present of the sequence represents a detection oligonucleotide of the invention.

New antisense oligonucleotide, useful for diagnosing, as research reagents and for treating disease states, which respond to modulation the synthesis or metabolism of cell adhesion molecules. e f

Example 5; SEQ ID NO 4; 72pp; English.

CC nucleotide is replaced with an adenosine, cytidine or guanosine considerable. The oligonucleotide is one of 88 disclosed antisense coligonucleotides targeting ICAM-1, vascular cell adhesion molecule (VCAM-C) vascular cell adhesion molecule (VCAM-C) or endothelial leukocyte adhesion molecule (BLAM-1). Also included are an RNA compound 8-80 nucleobases in length targeted to human ICAM-1 mRNA (where the compound specifically hybridises with the human ICAM-1 mRNA and inhibits the expression of human ICAM-1 mRNA), and a double stranded CC RNA compound having the RNA equivalent sequence of ADM46473. The CC oligonucleotide is useful for modulating the activity of the RNA and DNA cand the modulation of the synthesis and metabolism of specific cell adhesion molecules. It is also useful for the diagnosis, as research creating and for treating disease states, which respond to modulation of the synthesis or metabolism of cell adhesion molecules. The coligonucleotide is suitable for treating inflammatory ophthalmological coligonucleotide is reduced and inflammatory ophthalmological coligonucleotide is suitable for treating inflammatory ophthalmological coligonucleotide is suitable in the suitable The invention relates to an antisense oligonucleotide targeting human intercellular adhesion molecule (ICAM-1) having a sequence appearing as ADM46473. In the oligonucleotide, at least one adenosine nucleotide is replaced with a thymidine, cytidine or guanosine nucleotide, at least one thymidine nucleotide is replaced with an adenosine, cytidine or guanosine nucleotide, at least one guanosine nucleotide is replaced with an adenosine, thymidine or cytidine nucleotide or at least one cytidine nucleotide or at least one cytidine nucleotide or at least one cytidine

ADN08321
The invention relates to a novel isolated human protein for promoting the CC transformation of 3T3 cells and contains any of the 31 amino acid contains any of the 31 amino acid contains any of the 31 amino acid contains any of the proteins described an isolated polynucleotide that encodes any of the proteins described above; a vector containing any of the said polynucleotides; a host cell contain protein by culturing any of the said polynucleotides; a host cell colynucleotide or vector described above; a process for producing the polynucleotide or vector described above; a process for producing the collecting the product; and an antibody binding specifically with the collecting the product; and an antibody binding specifically with the collecting the product; and an antibody binding specifically with the collecting the product; and an antibody binding specifically with the collecting the product; and its encoded polynucleotide are cytostatic activity. The protein and its encoded polynucleotide are useful for promoting the transformation of 3T3 cells, together with captures and in gene therapy for the transent of disorders, such as cancer. This polynucleotide sequence represents a primer for the DNA encoding one of the 3T3 transformation promoting human proteins of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          allergic reactions. The oligonucleotides can also be used to preserve corneal explants ex vivo and to prevent corneal allograft rejections. specific hybridisation exhibited by the oligonucleotides may be used assays, purifications or cellular product preparations. The present sequence is an antisense oligonucleotide targeting ICAM-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 07-AUG-2002; 2002CN-00136401.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          á
                                                   문
                                                                          of a late-onset neurodegenerative disease to a patient which comprises
canalysing a sample from the patient to determine whether the patient has
a D-amino acid oxidase (DAO) abnormality, where the presence of a DAO
cabnormality is an indication that the patient has an increased risk of
the late-onset neurodegenerative disease. DAO is a flavin dinucleotide
(FAD) dependent oxidase which catalyses the oxidative deamination of D-
amino acids (EC.1.4.3.3). The method of the invention has neuroprotective
and antiparkinsonian applications and may be useful in determining an
increased risk of a late-onset neurodegenerative disease to a patient, as
well as in preparing a medicament for treating a late-onset
neurodegenerative disease, such as amyotrophic lateral sclerosis (ALS),
Parkinson's disease (PD) or Alzheimer's disease (AD), possibly via gene
therapy. The current sequence is that of a PCR primer of the invention
which was used during linkage analysis of human D-amino acid oxidase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

CC synthesis primer to RNA, separating the CDNA with an adaptor, through 5'-phosphate on strand (II) of the adaptor to single contacting the cDNA with an adaptor, ligating the cDNA contacting the cDNA with an adaptor, ligating the cRNA, separating the cDNA with an adaptor, ligating the cRNA, the adaptor through 5'-phosphate on strand (II) of the adaptor to single contacting the cDNA with an adaptor, ligating the cRNA, servanded with an adaptor to single contacting the cRNA with an adaptor to single contacting the method is consent from the method is consent from the cRNA with an amplifying the obtained ligated single consent from process, where the source of nucleic acid is chosen from blood, contacting plasma, cerebrosphinal fluid, urine, tissue samples, biopsies and collection of mRNA molecules in a sample, where the method is applied to collection of mRNA corresponding to the mRNAs by annealing one or more containing single stranded cDNA (sense) by use of streptavidin coated cCC where primer 1 is modified by biotin in the 5' end, isolating the biotin-containing single stranded cDNA (sense) by use of streptavidin coated magnetic beads, synthesising a double-stranded cDNA collection from a containing single stranded cDNA (anti-sense) by use of streptavidin coated magnetic beads, hybridised sub-population of the anti-sense cDNA is found, isolating the unhybridised sub-population of the anti-sense cDNA by use of streptavidin coated cDNA, and generating a second double-stranded cDNA collection from the unhybridised sub-population by CRC using primer 1 and populations of cDNA from language primer 1 and population single stranded cDNA.

CC production single stranded cDNA and generating a second double-stranded cDNA collection single stranded cDNA collection second collection of cDNA from a pre-selected cell collection single stranded cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ADO28710,

The invention describes a method of synthesising single stranded cDNA by CC a 5'-ligated adaptor-mediated process involving: annealing a cDNA CC synthesis primer to RNA, separating the cDNA strand from the RNA, CC purifying the cDNA, contacting the cDNA with an adaptor, ligating the CNA stranded from the RNA, CC purifying the cDNA ligase, and amplifying the obtained ligated single contacting the cNA stranded represent in an molecular amplifying the obtained ligated single consected process, where the source of nucleic acid is chosen from blood, contacting the tissue sample comprises a cell population which may be single saliva. The tissue sample comprises a cell population which may be single collection of mRNA molecules in a sample, where the method is applied to collection of mRNA molecules in a sample, where the method is applied to the mRNAs by annealing one or more containing single stranded cDNA collection from a first mRNA population by the method, where primer 1 is modified by biotin in the 5' end, isolating the biotin-coated magnetic beads, synthesising a double-stranded cDNA collection from a second mRNA population according to the method, isolating the mon-biotin-coated magnetic beads, hybridising to the method, isolating the mon-biotin-coated magnetic beads, hybridising to the method, isolating the mon-biotin-coated magnetic beads, hybridising the sense by use of streptavidin coated cDNA, and generating a second double-stranded cDNA is solating the mon-biotin-coated magnetic beads, hybridising the sense to the anti-sense cDNA, where the unhybridised sub-population of the anti-sense cDNA by use of streptavidin coated cDNA, and generating a second double-stranded cDNA collection from a second manakerse cDNA and generating a second double-stranded cDNA collection from the unhybridised sub-population of the anti-sense cDNA by use of streptavidin coated cDNA, and generating a second double-stranded cDNA collection from the unhybridised sub-population of the anti-sense cDNA by use of streptavidin coated c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RESULT 2121
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

RESULT 2122
             or more polymorphic microsatellite loci (PML). The method comprises: PCR amplification of at least one BNA region of (I) that includes PML, using as template a DNA sample containing at least one segment of (I), and determining the length of the resulting amplicon(s). Also described are: a method of determining (M2) microsatellite markers (MM) for predisposition to a disease, associated with a gene that includes one or compressed may be a method is used to identify microsatellite markers, in a disease-related gene, that are associated with a predisposition to disease-related gene, that are associated with a predisposition to disease-sease and for prediagnosis of such diseases, especially prion diseases but also cystic fibrosis, malignant hyperthermia syndrome in pigs and metabolic diseases; also to type genes that encode milk proteins, hormones or transcription factors. The method is simpler, quicker and particularly less expensive than known methods based on sequencing. This sequence represents a primer used to genotype a region of the human prion protein (PrP) comprising a polymorphic microsatellite locus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a method for constructing a synthetic polynucleotide from which a polypeptide is producible to confer a selected phenotype to an organism of interest or part in a different quality than that conferred by a parent polynucleotide that encodes the same polypeptide. The method comprises: (a) selecting a first codon of the parent polynucleotide for replacement with a synonymous codon, where the synonymous codon is selected on the basis that it exhibits a different phenotypic preference than the first codon in a comparison of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 18 BP; 3 A; 2 C; 9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Constructing synthetic polynucleotide for modulating the quality of a selected phenotype displayed by an organism comprises replacing a first codon with a synonymous codon to construct the synthetic polynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Synthetic

The method is useful for constructing a synthetic polynucleotide from which a polypeptide is producible to confer a selected phenotype to an organism of interest or part in a different quality than that conferred by a parent polynucleotide that encodes the same polypeptide. It is useful for modulating the quality of a selected phenotype displayed by an organism or part. The present sequence encodes appropriate leader sequence, which is used in an example from the present
                The present invention describes a method for constructing a synthetic polynucleotide from which a polypeptide is producible to confer a selected phenotype to an organism of interest or part in a different quality than that conferred by a parent polynucleotide that encodes the same polypeptide. The method comprises: (a) selecting a first codon of the synonymous codon is selected on the basis that it exhibite a different phenotypic preference than the first codon in a comparison of phenotypic preferences in test organisms or parts, where the test organism are selected from organisms of the same species as the organism of interest and organisms that are related to the organisms of interest; and (b) replacing the first codon with the synonymous codon to construct the synthetic polynucleotide. Also described: (1) a method for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 18 BP; 0 A;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Constructing synthetic polynucleotide for modulating the quality of a selected phenotype displayed by an organism comprises replacing a first codon with a synonymous codon to construct the synthetic polynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Synthetic leader sequence encoding DNA SEQ ID NO:75

cc interest or its parts; (2) a synthetic polynucleotide constructed from cc the method above; (3) an organism or interest or part containing a constructed from the method above; (4) an comparise or interest or part containing a synthetic construct that comparises a regulatory polynucleotide operably linked to a tandem repeat cof a first codon fused in frame with a reporter polynucleotide that cc encodes a reporter protein, which produces, or is predicted to produce a selected phenotype or a phenotype of the same class as the selected phenotype in the organism or part; (5) a method of modulating the quality of a selected phenotype that is displayed by an organism of interest or part and that results from the expression of a parent polynucleotide that ce encodes the polypeptide; (6) a method of enhancing the quality of a selected phenotype that is displayed by an organism of interest or part cand that results from the expression of a parent polynucleotide that ce encodes the polypeptide; and (7) a method of reducing the quality of a selected phenotype that is displayed by an organism of interest or part cand that results from the expression of a parent polynucleotide that concept that is displayed by an organism of interest or part cand that results from the expression of a parent polynucleotide that concept the polypeptide. The method is useful for constructing a selected phenotype to an organism of interest or part in a different can polypeptide. It is useful for modulating the quality of a selected phenotype to an organism of interest or part in a different the polypeptide. It is useful for modulating the quality of a selected phenotype displayed by an organism or part. The present sequence encodes the polypeptide. It is useful for modulating the quality of a selected phenotype that is useful for one part. The present sequence encodes the polypeptide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel method for identifying a subject at risk of breast cancer comprising detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The method of the invention has cycostatic applications and may be useful for identifying a subject at risk of the cancer, for early diagnosis, prevention and treatment of breast cancer, possibly via gene therapy, as well as to analyse and predict a response to a breast cancer treatment and in clinical drug trials. The CC current sequence is that of an Extend primer (also described as probe) of the invention which was used to genetype human intercellular adhesion CC molecule ICAM-1/ICAM-5 gDNA. ICAM-1 (human rhinovirus receptor; BB2 (D54; cell surface glycoprotein P3.58) has been mapped to chromosomal position 19p13.2-cen and ICAM-5 (telencephalin) has been mapped to chromosomal position 19p13.2-cen and ICAM-5 (telencephalin) has been mapped to chromosomal position 19p13.2-cen and ICAM-5 (telencephalin) has been mapped to chromosomal position 19p13.2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC pain, particularly in primary sensory neurons. The invention also containing particularly in primary sensory neurons. The invention also containing expression of the VR1 modulator, host cells containing to modulating expression of the VR1 receptor by introducing the condulation or the vector into a cell that contains the VR1 gene. The cc products of the invention are used for detecting a transcription factor from its binding to a regulatory sequence (or a double-stranded coligonucleotide fragment of it), e.g. by Western blotting or enzyme-cl inked immunosorbant assay, particularly for diagnosis of diseases case of associated with overexpression or underexpression of the transcription factor. The region that modulates VR1 receptor expression includes a binding site for a transcription factor, e.g. MZF1, NFkappaB, NFAT or care used for prevention or treatment of pain, also for treating them, cc sensitivity disorders, e.g. analgesia, hypalgesia or hyperalgesia, also contain sequence represents a fragment of human VR1 exon 1d DNA cc which is capable of binding to a transcription factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; drug

Identifying individuals having a polymorphism, useful for determining the effectiveness or side effect of a drug or treatment protocol, comprises detecting at least one polymorphism in the drug metabolizing enzyme nucleic acid.
                                                                                                                                                                                                                                                                                                                  27-DEC-2000; 2000JP-00399443.

CC valuating and screening drugs using genetic polymorphism data. Genetic colling the particularly that relating to single nucleotide colling polymorphism (SNPs), may be used in studying the relationship between colling sugar variations and human diseases, conditions, and responses to CNA sequence variations and human diseases. SNPs are also useful as polymorphism markers for discovering genes that cause or exacerbate certain diseases. SNPs are particularly useful colling the above respects as they are stable in populations, occur can the above respects as they are stable in populations, occur can the above respects as they are stable in populations, occur can genes encoding drug metabolising enzymes allows the customisation of colling drug metabolising enzymes allows the customisation of colling therapies based upon the genetic profile of individual patients.

CC reduce the likelihood of adverse reactions, thereby increasing safety. CC methods of the invention are also useful in the drug discovery and collinical trials only if their genetic profiles indicate that they are collinical trials only if their genetic profiles indicate that they are capable of responding to a particular drug or drug class, and previously failed drug candidates could be revived if they were matched with more appropriate patient populations. The methods, data and compositions of the reage of the reactions of the reage in the range of polymorphisms may be identified in a nucleic acid sample using probes or primers specific for a sequence selected from ABZ43217-ABZ50887 using a variety of detection assays, including hybridisation assays, nucleic acid arrays and PCR-based methods. The invention also encompasses methods of appropriate patient populations. The methods, data and compositions of the invention may therefore lead to an increase in the range of possible drug targets and decreases in the number of adverse drug reactions, failed drug trials, the time taken for a drug to be approved, the length of time patients are on medication and the number of different medications a patient needs to take before finding an effective therapy encoding enzymes associated with drug metabolism. The invention relates to methods and compositions for identifying individuals who have at least one polymorphism in such drug metabolising enzyme-encoding genes. Sequences ABZ43217-ABZ50887 represent polymorphic sites within genes

                                                                                                                                                                          밁
                                                                                                                                                                                                                     ş
                                                                                                                                                                                                                                                                                                                                                                                                                                    CC in the above respects as they are stable in populations, occur frequently, and have lower mutation rates than other genome variations cours such as repeating sequences. The detection and analysis of polymorphisms in genes encoding drug metabolising enzymes allows the customisation of cur therapies based upon the genetic profile of individual patients. CC This would not only take the guesswork out of selecting the drug with the createst therapeutic effect for a particular patient, but would also could not only take the guesswork out of selecting the drug with the createst therapeutic effect for a particular patient, but would also could be invention are also useful in the drug discovery and comproval processes. For example, individuals could be selected for capable of responding to a particular drug or drug class, and previously cfailed drug candidates could be revived if they were matched with more capable of responding to a particular drug or drug class, and previously capable of the invention may therefore lead to a an increase in the range of compositions of the invention may therefore lead to a an increase in the range of compositions, failed drug trials, the time taken for a drug to be approved, the length of time patients are on medication and the number of different capable of the patients are on medication and the number of different capable of the patients are on medication and the number of different capable of the patients are on medication and the number of different capable of the patient patient patient patient patient patient patients are on medication and the number of different capable drug trials.
                                                                                               RESULT 2130
                                                                                                                                                                                                                                                                         Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            evaluating and screening drugs using genetic polymorphism data. Genetic polymorphism data, particularly that relating to single nucleotide polymorphisms (SNPs), may be used in studying the relationship between polymorphisms (SNPs), may be used in studying the relationship between DNA sequence variations and human diseases, conditions, and responses to drugs. SNPs are also useful as polymorphism markers for discovering genes that cause or exacerbate certain diseases. SNPs are particularly useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequences ABZ43217-ABZ50887 represent polymorphic sites within genes encoding enzymes associated with drug metabolism. The invention relates to methods and compositions for identifying individuals who have at least one polymorphism in such drug metabolising enzyme-encoding genes. The polymorphism may be identified in a nucleic acid sample using probes or primers specific for a sequence selected from ABZ43217-ABZ50887 using a variety of detection assays, including hybridisation assays, nucleic acid arrays and PCR-based methods. The invention also encompasses methods of

Claim 23; Page 102; 2785pp; English. Sequences ABZ43217-ABZ50887 represent polymorphic sites within genes

CC evaluating and screening drugs using genetic polymorphism data. Genetic CC polymorphism data, particularly that relating to single nucleotide CC polymorphism (SNPs), may be used in studying the relationship between CC DNA sequence variations and human diseases, conditions, and responses to that cause or exacerbate certain diseases. SNPs are particularly useful in the above respects as they are stable in populations, occur frequently, and have lower mutation rates than other genome variation of Such as repeating sequences. The detection and analysis of polymorphisms CC in genes encoding drug metabolising enzymes allows the customisation of CC drug therapies based upon the genetic profile of individual patients. CC This would not only take the guesswork out of selecting the drug with the CC greatest therapeutic effect for a particular patient, but would also CC reduce the likelihood of adverse reactions, thereby increasing safety. CC clinical trials only if their genetic profiles indicate that they are CC capable of responding to a particular drug out they are capable of responding to a particular drug of the selected for CC failed drug canadates could be revived if they were matched with more appropriate patient, populations. The methods, data and compositions of the invention may therefore lead to a an increase in the range of compositions of the length of time patients are on medication and the number of different medications a patient needs to take before finding an effective therapy one polymorphism in such drug metabolising enzyme-encoding genes. The polymorphisms may be identified in a nucleic acid sample using probes or primers specific for a sequence selected from ABZ43217-ABZ50887 using a variety of detection assays, including hybridisation assays, nucleic acid arrays and PCR-based methods. The invention also encompasses methods of encoding enzymes associated with drug metabolism. The invention relates to methods and compositions for identifying individuals who have at least

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 41
Sequences ABZ43217-ABZ50887 represent polymorphic sites within genes encoding enzymes associated with drug metabolism. The invention relates to methods and compositions for identifying individuals who have at least one polymorphism in such drug metabolising enzyme-encoding genes. The polymorphisms may be identified in a nucleic acid sample using probes or primers specific for a sequence selected from ABZ43217-ABZ50887 using a variety of detection assays, including hybridisation assays, nucleic acid arrays and PCR-based methods. The invention also encompasses methods of evaluating and screening drugs using genetic polymorphism data, particularly that relating to single nucleotide polymorphisms (SNPs), may be used in studying the relationship between DNA sequence variations and human diseases, conditions, and responses to drugs. SNPs are also useful as polymorphism markers for discovering genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying individuals having a polymorphism, useful for determining effectiveness or side effect of a drug or treatment protocol, comprise detecting at least one polymorphism in the drug metabolizing enzyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              27-DEC-2000; 2000JP-00399443.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cc in the above respects as they are stable in populations, occur frequently, and have lower mutation rates than other genome variations cc such as repeating sequences. The detection and analysis of polymorphisms cc in genes encoding drug metabolising enzymes allows the customisation of cdrug therapies based upon the genetic profile of individual patients. Cc This would not only take the guesswork out of selecting the drug with the cgreatest therapeutic effect for a particular patient, but would also creduce the likelihood of adverse reactions, thereby increasing safety. Cc Methods of the invention are also useful in the drug discovery and capproval processes. For example, individuals could be selected for compable of responding to a particular drug or drug class, and previously cfailed drug candidates could be revived if they were matched with more cappropriate patient populations. The methods, data and compositions of the invention may therefore lead to a an increase in the range of cossible drug targets and decreases in the number of adverse drug cossible drug targets and decreases in the number of adverse drug.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to methods for haplotyping cholinergic receptor, nicotinic, beta polypeptide 3 (CHRNB3) gene. The invention also provides single nucleotide polymorphisms (SNP) in the human CHRNB3 gene. Polymorphic variants of CHRNB3 gene is used for screening for candidate drugs to treat diseases related to CHRNB3 activity. They are also useful in studying the effect of variation on the biological activity of CHRNB3 as well as on the binding affinity of candidate drugs targeting CHRNB3 for treating Alzheimer's disease and other neurological disorders. They are also useful in gene therapy. Compositions comprising CHRNB3 gene polymorphic variants are useful for genotyping and/or haplotyping and CHRNB3 gene in an individual. The present sequence is an allele-specific oligonucleotide (ASO) primer used to detect human CHRNB3 gene polymorphisms. Human CHRNB3 gene includes 8 polymorphic sites PS1-PS8
         present se
                                          The invention relates to methods for haplotyping glycoprotein Ib (platelet) alpha polypeptide (GPIBA) gene of an individual. The method involves determining if the individual has one of the GPIBA haplotypes haplotype pairs. The methods of the invention are useful for disease diagnosis and in the discovery and development of drugs for treating diseases associated with GPIBA activity e.g. Bernard-Soulier syndrome, platelet-type von Willebrand disease, HIV and Alzheimer's disease. The present sequence is allele-specific oligonucleotide (ASO) primer used for the sequence is allele-specific oligonucleotide (ASO) primer used for the sequence is allele-specific oligonucleotide (ASO) primer used for the sequence is allele-specific oligonucleotide (ASO) primer used for the sequence is allele-specific oligonucleotide (ASO) primer used for the sequence is allele-specific oligonucleotide (ASO) primer used for the sequence is allele-specific oligonucleotide (ASO) primer used for the sequence is allele-specific oligonucleotide (ASO) primer used for the sequence is allele-specific oligonucleotide (ASO) primer used for the sequence is allele-specific oligonucleotide (ASO) primer used for the sequence is allele-specific oligonucleotide (ASO) primer used for the sequence is allele-specific oligonucleotide (ASO) primer used for the sequence is allele-specific oligonucleotide (ASO) primer used for the sequence is allele-specific oligonucleotide (ASO) primer used for the sequence is allele-specific oligonucleotide (ASO) primer used for the sequence is allele-specific oligonucleotide (ASO) primer used for the sequence is allele-specific oligonucleotide (ASO) primer used for the sequence is allele-specific oligonucleotide (ASO) primer used for the sequence is allele-specific oligonucleotide (ASO) primer used for the sequence is allele-specific oligonucleotide (ASO) primer used for the sequence is allele-specific oligonucleotide (ASO) primer used for the sequence is allele-specific oligonucleotide (ASO) primer used for the sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; haplotyping; glycoprotein Ib (platelet) alpha protein; GP1BA Bernard-Soulier syndrome; platelet-type von Willebrand disease; HIV Alzheimer's disease; allele-specific oligonucleotide; polymorphism; primer; human immunodeficiency virus; ASO; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New haplotypes of the glycoprotein Ib platelet alpha polypeptide gene useful for diagnosis and drug discovery for treating Bernard Soulier syndrome, platelet-type von Willebrand disease, HIV and Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 15

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match
                                                                                                                                                      Query Match
                                                                                                                                                                                                                                                      The present invention describes an isolated polynucleotide (I) comprising a sequence which is a polymorphic variant (PV) of a reference sequence for aldo-keto reductase family 1, member B1 (AKRIB1) gene or its fragment, having the 22214 base pair sequence given in ABL01105. AKRIB1 has antidiabetic activity and can be used in gene therapy. AKRIB1 can be used in the treatment of diabetes. The human AKRIB1 gene is located on chromosome 7935. ABL01107 to ABL01129 represent allele-specific oligonucleotide (ASO) probes used in the detection of polymorphisms in the human AKRIB1 gene; ABL01130 to ABL01175 represent ASO primers used in the detection of polymorphisms in the human AKRIB1 gene; and ABL01176 to ABL01221 represent preferred primers used in the detection of polymorphisms in the human AKRIB1 gene;
